3.129 (a) FEEDING.

(a) The food shall be wholesome, palatable, and free from contamination and of sufficient quantity and nutritive value to maintain all animals in good health. The diet shall be prepared with consideration for the age, species, condition, size, and type of the animal.

Some of the hay being used to feed the goats was of poor quality. The affected bales were discolored and appeared to be moldy. Hay that was stacked contained bales that were moldy on the ends of the bales. A few whole bales near the stack appeared to be spoiled. Clumps of spoiled hay were also found in a feeder in a lot housing goats being treated for various medical conditions.

Poor quality hay may lack nutritive value needed to sustain the animals. Ingesting hay that is contaminated with mold may adversely affect the health of the animals. Providing low quality and contaminated feed to animals already in poor health may exacerbate underlying medical conditions.

A system should be in place to ensure that all food provided to the animals at the facility be wholesome, palatable, and free from contamination.

All poor quality and/or moldy hay should be removed from food storage areas by April 15, 2011.

Note:
An exit briefing was conducted with a facility representative.
Accompanied by Dr. Alexandra Andricos.
